                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention provides a tertiary structure for the peanut allergen Ara H 1 allergen is found to contain 23 linear IgE-binding epitopes. The invention also provides an isolated recombinant peanut allergen designated Ara h 3 and a nucleotide molecule encoding the peanut allergen Ara h 3. Molecules of the invention are used to protect a host animal from allergic reaction, particularly using a modified allergen which is less reactive with IgE. The invention may also be used to ensure that the allergen is not introduced into genetically modified food. The present sequence represents a DNA encoding the Ara h 3 allergen.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes an animal model which can be used for studying allergic reactions to allergens. The animal is sensitised to a selected antigen by administering the antigen itself or a nucleic acid encoding the antigen, where preferably the antigen is an anaphylactic antigen. The sensitised animal can then be used to screen for compounds which may help to prevent, ameliorate, or cure allergic conditions in humans. The animal model can be used for studying allergic reactions to allergens, such as those in food (peanuts, fruit, berry, nut, bean, milk, dairy products), or in the environment (weed pollen, grass pollen, tree pollen, animal dander, fungal, and insect antigens).

AAB33478 to AAB33601 represent sequences which are used in examples from the present invention to specifically examine the peanut allergy, and the

The sequence represents the amino acid sequence of modified anaphylactic antigen Ara h 3, which has been altered to disrupt immunoglobulin E (IgE) binding sites. Ara h 3 is an anaphylactic antigen (A), which was used to design antigent peptides having a reduced ability to bind IgE as compared with the intact (A), or having a sequence substantially compared with the intact (A), or having a sequence substantially compared with the intact (A), or having a sequence substantially identical to a portion of sequence of an antigen that includes at least come IgE binding site of the peptide come IgE binding site of the peptide is altered. The antigenic peptides are used in a composition which is useful for reducing risk or severity of allergic reaction to an antigen by identifying an individual at risk of allergic reaction to an antigen, or a familial relationship with an individual who previously displayed allergic symptoms when exposed to the antigen. Compassion of the antigen specific IgE present on one or more mast cells or basophils in the individual's serum is identified. The individual is then contacted with a peptide corresponding to a portion of the antigen. Which is selected, formulated, and delivered so that binding of the copinion of antigen-specific IgE is reduced as compared with IgE binding of the individual reactions is also useful for treating and preventing allergic reactions
                                                                                                                                                                                                                                                                                      to antigens, have reduced ability to bind Immunoglobulin E.

The sequence represents the amino acid sequence of modified anaphylactic peanut antigen Ara h 3. The protein is used for active or passive desensitisation of an individual to an antigen; for alleviating or preventing allergic reactions and for decreasing the risk of allergic reactions allergan and for decreasing the risk of allergic reactions during immunotherapy or tush immunotherapy, anaphylaxis and asthma. The antigen may be a food allergen (e.g. peanut or milk allergen), shellfish allergen, environmental allergen (e.g. grass pollen or tree pollen), latex, durg, pollen, ovalbumin, an insect venom antigen or predominantly linear epitopes. The protein is useful for protecting an or predominantly linear epitopes. The protein is useful for protecting an individual against subsequent inadvertent or intentional exposure to antigen, e.g. receiving blocking agent before eating a chocolate bar which may inadvertently contain peanut components or before eating foods prepared using peanut oil. Administration of the blocking agents does not essult in cross-linking of anti-antigenic immunoglobulin E (igs). After exposure to the agent, the individual's antigen sensitivity is at least temporarily reduced. Only those Igs molecules that bind the offending antigen and contribute to the risk of an allergic response are blocked
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Preventing allergic response against antigens, e.g. food and environmental allergens such as peanut allergen or grass pollen, latex or drug, comprises administering agent, e.g. a peptide, that blocks antigen binding sites on offending Igs.

Example 3; Page 21-22; 90pp; English

universe depictope of interest. Suppressing an immune response directed toward an MHC Class II-presented epitope of interest comprises: providing toward an MHC Class II-presented epitope of interest comprises: providing to mucleic acid sequence encoding the MHC Class II-presented epitope of interest, the nucleic acid sequence encoding an Ii-Key motif located 4-11 amino acids upstream from the N-terminal residue of the MHC Class II-presented epitope of interest, and modifying the Ii-Key motif. Enhancing an immune response directed toward an MHC Class II-presented epitope of interest, the nucleic acid sequence lacking interest comprises: providing a nucleic acid sequence encoding the MHC Class II-presented epitope of interest, the nucleic acid sequence lacking an Ii-key motif located 4-11 amino acids upstream from the N-terminal residue of the MHC Class II-presented epitope of introduce an Ii-key motif appropriately can Ii-key motif appropriately can II-presented epitope of introduce an II-key motif appropriately can contact and modifying the MHC Class II-presented epitope. The protein or polypeptide of interest corresponds to a protein or polypeptide encoded by an infectious pathogen selected from anthrax, EBOLA, HIV or influenza, preferably vaccinia virus. The non-naturally occurring protein or polypeptide (I) modified by recombinant DNA techniques is useful for treating infectious diseases caused or associated with infectious diseases caused or associated with infectious agents. It is also useful for treating rheumatoid arthritis, multiple scherosis, lupus erythematosus, diabetes mellitus, myasthenia gravis, allergic rhinitis, topical dermathis, conter, psoriasis or adenomas. The present sequence represents the amino acid sequence of peanut allergen Ara h 3 used in the invention. The invention relates to a non-naturally occurring protein or polypeptide (I) modified by recombinant DNA techniques comprising: a C-terminal element comprising an MHC Class I presented epitope; an N-terminal element comprising an II-key motif; and an intervening element comprising as sequence of 4-11 amino acid residues where the modification by recombinant DNA techniques taking place within elements (b) and (c). Also described are methods for: suppressing or enhancing an immune response directed toward an MHC (major histocompatibility complex) Class II-

The structure can be used for improving processability of soya protein. The present amino acid sequence represents the Glycine max (Soybean) var. Dare protein, as described in the specification

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel method for reducing the expression of at least two different endogenous target genes in a eukaryotic cell or organism by introducing an RNA molecule that is at least partly double stranded. The transcribed RNAS from at least two target genes have homology below 90% and the RNA molecule is formed as a single, self-complementary molecule. At least one of the double-stranded structures formed from individual sense sequences has an even number of repeats of 1 or 22 bp. The RNA molecule may include an intron-encoding sequence. At least two target genes are selected from different classes of storage protein genes, i.e. 28-albumen, 78- or 18/128-globulins or zein-prolamine and at least one of the sense sequences is identical to storage protein sequences or genes in the homogentistate metabolic pathway or

cc enzyme types, e.g. acetyl transacylases, thioesterases, (de)branching enzymes or cellulases. The RNA of the invention, also related cassettes, expression systems, vectors and transgenic organisms are used for preparation of pharmaceuticals, in biotechnological processes and plant biotechnology, specifically in plants to improve protection against.

Cc ablotic stress, to modify camposition and/or content of fatty acids, clipids and oils, to modify carbohydrate composition, to alter colour or pigmentation, to reduce content of storage proteins, to increase cresistance to pathogens, to inhibit stem break, to delay fruit ripening or aging, to induce male sterility, to reduce content of toxic or contents, to modify lignification and/or lignin content, to modify the fibre component in foods or fibre quality in cotton, to reduce susceptibility to shock, to increase synthesis of vitamin E, to reduce contents of nicotine, caffeine or theophylline and to increase methionine contents of nicotine, caffeine or theophylline and to increase methionine contents by reducing threonine biosynthesis. The method provides a rapid and efficient way of reducing gene expression, can inhibit more than one target gene, prevents development of multiple phenotypes (since the transcription rate is the same for all RNA sequences, significantly creducing the selection process required to produce an organism with ceffective suppression of all target genes), avoids problems of epigenic conditions and the method can be applied to plants with complex (polyploid) genomes. No interference between the individual RNA sequences cour. This sequence contents in the method of the individual RNA sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 120

ADL90187 standard; protein; 481 AA.

ADL90187 ID ADL9

```
containing a recombinant fusion protein; attaching the recombinant fusion protein to a substrate through the native protein; contacting the recombinant fusion protein to a substrate through the native protein; contacting the recombinant fusion protein and detecting the binding of immunoglobulin E sample from an individual; and detecting the binding of immunoglobulin E complexity of an molecules in the biological sample to the recombinant fusion protein.

Also described are: a method for determining the sensitivity of an individual to a suspected allergen; a method for determining the amount of immunotherapy; a method of allergen characterisation; a method of determining the sensitivity of an individual to a suspected allergen; a method of determining the amount of immunoglobulin E specific for an allergen in a biological sample; a kit comprising the recombinant fusion protein to conferent and instructions for using the recombinant fusion protein to determination. The method is uspected allergen; and a method for epitope determination. The method is soybean glycinin G2 acidic protein.

C This is the amino acid sequence of soybean glycinin G2 acidic protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           61 AATCGCATTGAATCAGAGGGGGGTTACATTGAGACTTGGAACCCCAACAACCAGGAGTTC 120

```
content of a plant by reducing the amount of at least one storage protein in the plant (or its tissue, organs, parts or cells) and selecting plants that have higher total oil content than starting plants. The storage protein is suppressed by introducing antisense RNA, optionally combined with a ribozyme, sense RNA that induces co-suppression, DNA-binding factors directed against storage protein genes, viral sequences that degrade storage protein genes, viral sequences that recombination of endogenous storage protein genes or mutations into storage protein genes. Most preferably a plant cell is stably transfected
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes a novel method for increasing the total oil

with a recombinant expression construct, then regenerated to plants that express the incorporated sequence. The expression constructs particularly contain a seed-specific promoter and they are introduced into plants by standard methods, e.g. via Agrobacterium. The preferred storage proteins of the invention are 2S-albumens, 7S or 11S/12S-globulins or zeinprolamines. Transgenic organisms produced by the new method are used for production of oils, fats, free fatty acids or their derivatives, useful as foods, animal feeds, pharmaceuticals and fine chemicals. This sequence interpresents a storage protein used to illustrate the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   200

                                                                                                                                 The present invention relates to a new Glycinin characterised by the atomic coordinate data fully defined in the specification. The structure can be used for improving processbality of soya protein. The present amino acid sequence represents the Glycine max (Soybean) var. Shirotsurunoko protein #2, as described in the specification
                                                                                                                                                                                                                                                                                                                   39

"Characterization of the glycinin gene family in soybean.";
Plant Cell 1:313-328(1989).
-!- FUNCTION: Glycinin is the major seed storage protein of soybear Submit Hexamer; each subunit is composed of an acidic and a basic chain derived from a single precursor and linked by a disulfide bond.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Interchain (By similarity)

Biol. Chem. 259:13431-13435(1984).

-!- FUNCTION: Glycinin is the major seed storage protein of soybean.
-!- SUBUNIT: Hexamer; each subunit is composed of an acidic and a basic chain derived from a single precursor and linked by a disulfide bond.
-!- SIMILARITY: Belongs to the 11S seed storage protein (globulins)

Urade R., Nakatani H., Nakano C.;
"mRNA of soybean proglycinin AlaBib subunit.";
Submitted (JUN-2003) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Glycinin is the major seed storage protein of so-
-!- SUBUNIT: Hexamer; each subunit is composed of an acidic an
basic chain derived from a single precursor and linked by disulfide bond.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      protein; Signal

Submitted (JUL-1999) to the EMBL/GenBank/DDBJ databases.
-!- SUBUNIT: Hexamer; each subunit is composed of an acidic and a basic chain derived from a single precursor and linked by a disulfide bond (By similarity).
-!- SIMILARITY: Belongs to the 11S seed storage protein (globulins)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAGITCTTCGTTCCACCGTCTCAGCAGTCTCCGAGGGCTGTGGCT 1521
